Finding Your Way Without Map Or Compass

Synopsis

During his remarkable lifetime, Harold Gatty became one of the world's great navigators (in 1931, he and Wiley Post flew around the world in a record-breaking eight days) and, to the benefit of posterity, recorded in this book much of his accumulated knowledge about pathfinding both on land and at sea. Applying methods used by primitive peoples and early explorers, the author shows how to determine location, study wind directions and reflections in the sky, even how to use the senses of smell and hearing to find your way in the wilderness, in a desert, in snow-covered areas, and on the ocean. By observing birds and other animals, weather patterns, vegetation, shifting sands, patterns of snow fields, and the positions of the sun, moon, and stars, would-be explorers can learn to estimate distances and find their way without having to rely on a map or a compass. The wealth of valuable data and advice in this volume "much of it unavailable elsewhere" makes it indispensable for hikers, bikers, scouts, sailors, and outdoorsmen "all those who might find themselves stranded or lost in an unfamiliar area. Through careful study of this book and its lessons, pathfinders can learn to interpret signs in the natural world to find their way in almost any kind of terrain.

Book Information

Paperback: 288 pages

Publisher: Dover Publications; Reprint edition (March 19, 1999)

Language: English

ISBN-10: 048640613X

ISBN-13: 978-0486406138

Product Dimensions: 0.5 x 5.8 x 8.5 inches

Customer Reviews

To review what I like about this book would go on and on. Basically the description covers all you need to really know about what's in it. It's all very illuminating... when you think you know quite a bit it turns out you probably don't. There's so much I learned from this book, and I was in the US Navy. They didn't cover a fraction of this in bootcamp. Even later on when I was in the Enlisted Surface

Warfare Specialist program, which encompasses a supreme amount of navigation knowledge, they barely even touched on but a few of these methods. It's a shame... I wish this was a mandatory read for my shipmates and I. I did however find it a wee bit frustrating to read. I've never read a book that beats a dead horse so badly. Halfway through the book I felt that if I read one more word about how 'there's no sixth sense' I was going to burn it. There's even a whole chapter based on it... and this isn't the only point he beats to death either. He's very long-winded when it comes to describing things, for example, here he lists things a person can hear of the land while he is offshore (as if we didn't already know): "He can listen to the sound of chopping, sawmills, church bells, whistles, to the rumble of trains and other industrial and highway noises, to the lowing of cattle, the crowing or cackling of poultry, the bleating of sheep, to waterfalls and rapids or the sea's surf". --now, tell me that couldn't have been shortened a bit. Ugh! He also tends to give way too many examples from the pages of history or his own experience. While this is pretty informative and sometimes appreciated, it's not the most useful information... like I don't need you to prove what you just said; I believe you, man.

The author of this book died in 1957 but the estate of Harold Gatty chose to publish this guide. In my opinion, this was a wise decision as this is an absolutely phenomenal book. The author, who was an accomplished navigator, describes how to use the wind, sky, clouds, sun, shadows, reflection in the sky, trees, animals, termite mounds, etc. to determine direction (north, south, east, or west). Also, he makes it clear that no part of the world is without signals--whether it be desert, the Arctic, the sea, Antarctica, etc. It is clear that we as a society have lost our quick ability to observe what nature is telling us. This is not a "how to" book; instead the author explains through stories and examples of how previous explorers found their way and how he has done so as well. In addition to using natural surroundings, he also describes how to navigate your way through towns and cities by determining direction based on the way a house was placed or where the kitchen is. The reason you can do this is that certain regions face their houses toward the sun or toward the wind - it depends on the place. Of course, this book will only guide you and it is not designed to be your only reference source as the observer must learn the prevailing details associated with their area, such as from which way the prevailing winds blow, before they can be a successful navigator. Mr. Gatty encourages you to pay attention to your surroundings and to pick out directional details from everything in your environment (including insects or houses). In a beginning example in the book, he describes how he can tell where a picture was taken, at what time of day, and which direction the house is facing.
