I think it is important that readers understand precisely what this 931-page book is, and what it is not. Dr Noakes is a trained physician, a professor of exercise science, and a highly published researcher in the field of exercise physiology. His meticulously researched book (the online references occupy over 100 pages) offers an authoritative compilation of the latest and best

research to guide the intelligent coach or self-coached runner in the structuring of productive and safe training regimens. For those who lack a PhD in physiology but still want to understand WHY they should perform specific types of training, based on current research, this book is simply unsurpassed. If all you want is a "table" of training prescriptions with no grounding in research or explanation of validity, then look elsewhere: this book is not for you. In my opinion, Dr Noakes has done an excellent job of extracting results from current research and translating them from the highly specialized language of sports physiology into language that the intelligent layperson can understand. Indeed, I found the book pitched at a slightly less technical level than the popular competitor by Martin and Coe---a book I have also found to be invaluable. Perhaps the most interesting feature of the Fourth Edition is Noakes' unapologetic challenge of THE prevailing paradigm in distance running; he questions the widely accepted belief that an individual's VO₂ max, or maximal oxygen uptake figure, is the key limiting factor in distance running performance.

I have been reading about running for the past couple of years--probably more than I ought to. I came upon this book recently in the library (most of my reading is online!) and upon poring through its pages have realized that a lot of what I've read either came from this book, or this book has a lot of what I've read in it. Noakes has written this tome relying upon the best science we have for running with all of its available studies. He bases his conclusions and statements on journal articles where possible and where not does not go overboard in conjecture. He is an accomplished marathoner and ultra marathoner and in his practice has treated a lot of runners. Go ahead and buy any book on running. It will have a section on nutrition with the basics that we all know. Contrast with the nutrition section in this and it's actually worth reading; he spends many pages on such details as the proper sodium levels in a beverage, the amount of liquid we need to drink while exercising (not the vague catch-all of "drink as much as you sweat"). His guides on injury and footwear are the best researched I've found anywhere. This is not just the best book on running I've seen, it's the best book by far. I slight this book in two areas: 1) Injury treatment seems to be really slanted substantially toward footwear and orthotics. Now, there may be a reason for that I'm not aware of, and he does give time to exercises and "holistic" approaches for injury prevention, including training the hips for, say, a knee problem and not just the feet, but I would have just preferred a bit more. 2) Running technique.
